

## Smart Iron Controller

### Features

- Build in RC oscillator for sensor signal detection
- On chip shunt regulated power supply
- Using AC 60Hz/50Hz as timer clock can select by Part No.
- Accurate timer with error dropping in  $\pm 1\%$
- Sensitive movement detection
- Powerful immunity of sensor Vibration
- 30s time out for IRON in static horizontal position
- 8min/10min/15min time out for IRON in static vertical position
- LED to indicate operation status
- Usable in both 120V and 240V voltage supply system
- Quick function test mode
- Support buzzer
- Few external components
- System standby mode power dissipation less than 1W ( :s)
- DIP-8 and SOIC-8 package
- Patent No: ZL 2005 2 0048330.4

### Applications

- Electric Iron Controller

### Description

The PT8A3514/15/16/17/18/19(A/B) are high performance low power and low cost CMOS chips designed for intelligent electric IRON controller. Their intelligence mainly results from their sensitive detection to the movement and static position of electric iron by using a special sensor. With the sensor, these chips can detect the vertical/horizontal position and movement status of IRON.

These chips are equipped with on-chip shunt regulator, sensor signal processor, build-in oscillator, timer, logic control, power on reset and output driving block etc.

### Pin Assignment

### Pad Description

Pin No.	Pin Name	I/O	Description
1	DISC/BUZ	O	Discharge the external electrolytic cap to stabilize and limit its voltage. Output 4KHz to driver buzzer when timer is out. Active high.
2	RELAY	O	Relay drive output, active high.
3	LED	O	With open drain output, it can shut off external LED in parallel with this open-drain transistor, active low.
4	GND	-	Ground.
5	TEST	I	Low for test mode*.
6	SW	I	Sensor signal input, input high will be considered horizontal.
7	ACCLK	I	AC 60/50Hz signal for clock with Schmitt architecture, internal drop down.
8	VCC	-	Power supply.

## Maximum Ratings

Storage Temperature.....	- 40°C to +125°C
Supply Voltage to Ground Potential (Inputs & V <sub>CC</sub> only).....	- 0.5 to V <sub>CC</sub> +0.5V
Supply Voltage to Ground Potential (Outputs & D/O only)....	- 0.5 to V <sub>CC</sub> +0.5V
DC Input Voltage .....	- 0.5V to V <sub>CC</sub> +0.5V
DC Output Current .....	..20mA
Power Dissipation.....	..500mW

### Note:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

**Functional Description** (Refer to *Block Diagram*)

The chip is comprised of several blocks: on-chip shunt regulator, sensor signal processor, build-in system oscillator, 30s/8min/10min/15min timer, logic control circuit, and power on reset, etc. Each block will be described as below.

**Logic control circuit**

Logic control circuit mainly carries out logic control function. It not only collects signals from other blocks, but also generates various driving signals including RELAY&DISC. Besides, an external LED will flash at about 1Hz and a buzzer will make a sound with a frequency of 4KHz every 0.5s for 6 times or continual after internal timer times out. Signals at RELAY will control external relay to decide whether IRON heats or not.

**Sensor signal processor**

The core in the whole system is how to correctly detect the position and movement of sensor so that the system can be always under safe control. Thus, it is critical to accurately and correctly deal with signal from sensor in different status and eliminate the noise caused by debounce action from sensor. Here, a unique structure is used to do the high-requirement signal processing.

In real application of IRON, sensor needs to be installed according to certain requirements (for example its inclination).

**Timer**

Timer block mainly generates various timing signal according to the position of IRON.

It is easy to get accurate timer (30s/8min/10min/15min) by using AC 60Hz/50Hz signal as timing reference. As above description, Iron in Horizontal position over 30s will stop heating. While Iron in vertical position over 8min/10min/ 15min will also stop heating.

**Buzzer**

A buzzer will make 0.5S sound with a frequency of 4 KHz for 6 times or continual after internal timer timeouts.

**LED**

During heating, LED pin is floating and an external LED will turn on. After times out, LED pin outputs pulse and an external LED will flash at about 1Hz.

### Application Circuit

**Note:** Suggest the parameters of relay meet the following specification: 24VDC, 1.6KΩ Coil resistance
