# LV88551

# Motor Driver, Single-Phase, PWM, Full-Wave, BLDC Motor

**ON Semiconductor®**

## Overview

The LV88551JA/R is the pre−driver for a single−phase BLDC motor, which has the closed loop controller for motor rotation speed. This is available to control a motor with low vibration and the low noise. In addition, lead−angle adjustment is possible by external pins. Lead−angle value and lead−angle slant can be adjusted independently. Thus, the device can be driven by high efficiency and low noise with various motors. Motor speed setting curve is adjustable for many variety using external resistor only. As a method of the rotary speed control of the motor, direct−PWM pulse input.

## Features

- Single−phase Full Wave Drive Pre−driver Include Closed Loop Speed Control
- Speed Control Function by PWM Duty Input (25 Hz to 100 kHz)
- Soft Start−up Function and PWM Soft Switching Phase Transition
- Soft PWM Duty Cycle Transitions
- Built−in Current Limit Circuit and Thermal Protection Circuit
- Built−in Locked Rotor Protection and Auto Recovery Circuit
- FG Signal Output
- Dynamic Lead Angle Adjustment with Respect to Rotational Speed
- Lead−angle Control Parameters can be Configured
- These are Pb−Free Devices

## Typical Applications

- PC & Computing Equipment
- Refrigerator
- Games

**Table 3. PIN FUNCTION DESCRIPTION (Pin No. – SSOP20J Version)**

| Pin No. | Pin name | Function |
|---|---|---|
| 1<br>19 | O1L<br>O2L | Output pins of the low–side gate–drive signal.<br>(See "Truth table" on page 4 for the polarity) |
| 2<br>20 | O1H<br>O2H | Output pins of the high–side gate–drive signal.<br>(See "Truth table" on page 4 for the polarity) |
| 3 | VCC | Power supply pin.<br>The input voltage to this pin must be stabilized without the influence of the noise, ripple, and etc.<br>Therefore, it is necessary to connect the capacitor near VCC pin and GND pin as much as possible. It must be over 1 μF about the value of this capacitor. Not to detach it. |
| 4 | REG | The output pin of the regulated voltage (5.0 V).<br>It is necessary to connect the capacitor near this pin and GND pin for stabilizing this regulated voltage. |
| 5 | VDD | Logic circuit power supply pin.<br>This pin should be shorted to REG pin. |
| 6<br>7 | PIX<br>PIZ | The pin to adjust the value of PWM input duty for the point of maximum or minimum rotation speed. |
| 8<br>9 | RSA<br>RSB | The pin to adjust the target value of maximum or minimum rotation speed. |
| 10 | FG | The output pin of the rotational signal.<br>When not using it, this pin should be opened [not connected]. |
| 11<br>12 | IN1<br>IN2 | Input pins of hall signals. |
| 13 | SFS | The pin to adjust the soft start state and dead time. |
| 14 | LAG | The pin to adjust the gradient of lead angle for PWM input duty. |
| 15 | LAI | The pin to adjust the initial lead angle in minimum rotation speed. |
| 16 | PWM | The input pin of the speed control signal as the rectangular wave. |
| 17 | GND | GND pin. |
| 18 | RF | The pin to detect the output current.<br>When the voltage level at this pin exceeds the internal set detection level, outputs turn to the regenerating mode. |

## STATE DIAGRAM

**Figure 19. State Diagram**

## FUNCTIONAL DESCRIPTION

**Current Sense Resistor Pin (RF)**

RF is current sense input terminal.

Voltage across the sense resistor represents the motor current and is compared against the internal $VTH_{OVC}$ (0.10 Vtyp.) for setting the over−current limiter (CLM).

**VCC and GND Pin (VCC, GND)**

Since Power FET side ground line has to tolerate surge of current, separate it from the GND pin as far away as possible and connect it point−to−point to the ground side of the capacitor (C0) between VCC and GND.

**Internal 5.0V Voltage Regulator Pin (REG, VDD)**

REG is internal 5.0 V voltage regulator.

VDD is power supply for internal logic, oscillator, and protection circuits. Please connect REG and VDD.

When PIX, PIZ, RSA, RSB, LAI, LAG and SFS are used, it is recommended that application circuits are made using this output. The maximum load current of REG is 20 mA. Warn not to exceed this. Place capacity from 0.1 µF to 1.0 µF in the close this pin.

**Rotational Signal Pin (FG)**

Frequency of the FG output represents the motor's electrical rotational speed. It is an open drain output. Recommended pull up resistor value is 1 kΩ to 100 kΩ. Leave the pin open when not in use.

**Output Pins for External FET Control (O1H, O1L, O2H, O2L)**

These pins are output for external MOSFET. O1H and O2H connect to upper side P−ch FET's gate−line. O1L and O2L connect to lower side N−ch FET's gate line.

**Hall−Sensor Input Pins (IN1, IN2)**

Differential output signals of the hall sensor are to be interfaced at IN1 and IN2. It is recommended that 0.01 µF capacitor is connected between both pins to filter system noise.

When a Hall IC is used, the output of the Hall IC must be connected to the pin IN1. And, the pin IN2 must be kept in the middle level of the Hall IC power supply voltage.

**Command Input (PWM)**

This pin reads the duty cycle of the PWM pulse and controls rotational speed. The PWM input signal level is supported from 2.5 V to 5 V. The combination with the rotational speed control by DC voltage, is impossible.

When the pin is not used, it must be connected to ground. The minimum pulse width is 100 ns.

**Lead−Angle Setting Pin (LAI, LAG)**

LV88551JA/R provides the dynamic lead angle adjustment. To match the motor characteristics, set two point lead−angel amounts, low speed side (set by LAI pin) and high speed side(set by LAG pin).

At middle range of input duty, the lead−angle amounts applied to calculated value for relative relationship.

The DC voltage levels applied to these pins are converted to the lead angle parameter. The voltages are fetched right after the power−on−reset. Because the internal conversion circuit works inside REG power rail, it is recommended that the LAI and LAG voltages are made from $V_{REG}$.

**Rotation Speed Setting Pin (RSA, RSB)**

LV88551JA/R provides the feedback speed control, so this device can set the rotation speed value (RPM) directly.

To make the motor speed setting curve, set two point rotation speed value, high speed side and low speed side.

The DC voltage levels applied to these pins are converted to the rotation speed parameter. The voltages are fetched right after the power−on−reset. Because the internal conversion circuit works inside REG power rail, it is recommended that the RSA and RSB voltages are made from $V_{REG}$.

**Rotation Speed Curve Duty Setting Pin (PIX, PIZ)**

To make the motor speed setting curve, set two point input duty parameter, high speed side and low speed side.

The DC voltage levels applied to these pins are converted to the input duty parameter. The voltages are fetched right after the power−on−reset. Because the internal conversion circuit works inside REG power rail, it is recommended that the PIX and PIZ voltages are made from $V_{REG}$.

**Soft−Start and Dead Time Setting Pin (SFS)**

LV88551JA/R provides synchronous rectification drive for high efficiency drive. External FET size is variable caused by the motor application. So this driver IC is able to choose 2 type dead time.

Soft start function pattern is able to choose from 16 types.

The DC voltage levels applied to these pins are converted to the soft−start setting and dead time parameter. The voltage is fetched right after the power−on−reset. Because the internal conversion circuit works inside REG power rail, it is recommended that the SFS voltage is made from $V_{REG}$.

## DETAILED DESCRIPTION

As for all numerical value used in this description, the design value or the typical value is used.

### Rotation Speed Curve Setting Description

The LV88551JA/R can set 2 points speed parameter arbitrarily.

Low speed point (LSP)

High speed point (HSP)

And at middle range of input duty, the rotation speed applied to calculated value for relative relationship.

**Figure 20.**

When the input duty is lower than LSP setting duty, the LV88551JA/R can select "motor stop" or "keep LSP rotation speed".

When the input duty is higher than HSP setting duty, the LV88551JA/R can select "free run" or "keep HSP rotation speed".

Rotation speed of LSP and HSP is set by RSA and RSB pin. The case of RSA > RSB, "motor stop" mode applied. The case of RSA < RSB, "keep LSP rotation speed" mode applied.

Input duty of LSP and HSP is set by PIX and PIZ pin. The case of PIX > PIZ, "free run" mode applied. The case of PIX < PIZ, "keep HSP rotation speed" mode applied.

So LV88551JA/R can't set decease speed curve at input duty increase.

Figures 21 – 24 show setting curve example.

**Figure 25. A–D Code Figure for RSA/RSB Pin**

Voltage of RSA/RSB is calculated by below formula.

$$\mathrm{VRSA, VRSB[V]} = \frac{\mathrm{VREG}}{512} \times \text{Target RPM's A\_D code} \qquad \text{(eq. 1)}$$

**Figure 26. Input Duty Parameter Setting for PIX/PIZ Pin**

Voltage of PIX/PIZ is calculated by below formula.

$$\mathrm{VPIX, VPIZ[V]} = \mathrm{VREG} \times \frac{\text{Target Duty[\%]}}{100} \qquad \text{(eq. 2)}$$

**Lead–Angle Setting Description**

LV88551JA/R provides the dynamic lead angle adjustment. To match the motor characteristics, set two points lead–angel amounts. Settable range is –22.225° to +22.225° (0.175° step).

LV88551JA/R can set delay angle setting. Minus value means delay angle.

LSP's value set by LAI pin
HSP's value set by LAG pin.

At middle range of input duty, the lead–angle amounts applied to calculated value for relative relationship.

**Figure 27. Lead–Angle Parameter Setting for LAI/LAG Pin**

Voltage of LAI/LAG is calculated by below formula.

$$\mathrm{VLAI, VLAG[V]} = \frac{\mathrm{VREG}}{2} + \mathrm{VREG} \times \frac{\text{Target Lead Angle Value [°]}}{44.45} \qquad \text{(eq. 3)}$$

Lead angle amounts of LSP and HSP doesn't care each relationship of large/small.

**Soft Start Setting Description**

LV88551JA/R has soft start function.

To avoid the motor rush current, when the motor booting timing output PWM duty rise−up from zero slowly.

The soft start action release conditions are below

− Rotation speed reach to target speed decided by PWM input.

− Output duty reach to "Release duty".

When reach to release condition, change to closed− loop speed control mode.

If the motor can't rotation during 0.7s (typ) , lock protection function works.

The recommendation of soft−start time is 1.72 s. Hence, it can be set by A−D code "0" and "31" for easy implementation by pin pull−down or pull−up.

| A–D code | Soft–start time(s) | Release duty(%) | Dead time(us) |
|---|---|---|---|
| 0 | 1.72 | 86 | 0.5 |
| 1 | 0.03 | 86 | 0.5 |
| 2 | 0.86 | 86 | 0.5 |

**Figure 30. Soft–start and Dead Time Setting Table for SFS Pin**

**Figure 31. A–D code Figure for SFS Pin**

Voltage of SFS is calculated by below formula.

$$VSFS[V] = \frac{VREG}{32} \times \text{Target Setting's A\_D Code} \quad \text{(eq. 4)}$$

**Output Waveform**

LV88551JA/R output PWM frequency is fixed by inner oscillator parameter, 48 kHz (typ)

Not concern with input PWM frequency.

Driving method of LV88551JA/R using PWM soft switching drive with synchronous rectification.

Soft switching width is changed by input PWM duty.

When the input duty is HSP setting duty, soft switching width is narrow (S/L = 20.5%)

On the other hand when the input duty is LSP setting duty, soft switching width becomes wide (S/L = 46.9%)

**Figure 32.**

In this part, the rise/fall time of soft switching waveform is equal. Therefore, the "S" in the figure can be also applied to fall time.

At the middle range input duty, the soft switching width is applied to calculated value for relative relationship.

## Protections

LV88551JA/R has some protection function.
– Thermal shutdown protection (TSD)
– Under voltage lock out (UVLO)
– Current limiter (CLM)
– Lock protection

When the TSD or Lock protection worked, external FETs are all turn off.

The other hand, when UVLO or CLM worked, output is PWM off and becomes re−circulation state.

## Thermal Shutdown Protection (TSD)

When this IC's junction temperature rise to 180°C (typ), O1H/O2H output turn to high, and O1L/O2L output turn to low. External FETs are all turn off and coil current shut off.

Next, IC's junction temperature fall to 150°C (typ), thermal shutdown function is released and motor start to rotate.

## Under Voltage Lock Out (UVLO)

UVLO work voltage: VCC 3.4 V (typ)
UVLO release voltage: VCC 3.6 V (typ)

## Current Limiter (CLM)

When the coil current increases and the voltage of the RF pin rises to 0.1 V (typ), the CLM operates and shut the coil current.

CLM current is adjustable by resistor value between RF−GND.

The sense resistor value is calculated as follows.

$$\text{Sense Resistor}[\Omega] = \frac{\text{VTH}_{CLM}[V]}{I_{CLM}[A]} \qquad \text{(eq. 5)}$$

For example, to set the CLM current threshold at 2 A, the sense resistor value is

$$\text{Sense Resistor} = \frac{0.10(\text{typ})}{2.0}$$
$$\text{Res} = 0.05\ [\Omega] \qquad \text{(eq. 6)}$$

## Lock Detection and Lock Protection

When the motor lock is happened, heat is generated because IC continues to supply electricity to the motor. And IC detects this radiated heat and turns off the electricity to the motor.

Under motor rotation state, if this IC does not receive the FG edge for 0.3sec (under 50 rpm),This IC judges " motor lock" and operates lock protection function.

**Figure 33.**

It takes 3.5 s for lock protection time (1st to 4th protection time). This equals to the total of lock detection time and lock protection time.

The lock detection time – the lock protection time ratio is approx. 1:5 (from 1st to 4th protection time).

After 5th protection time, the lock protection time becomes 14s and protection−start time ratio is approx. 1:20 (after 5th protection time)

## PCB GUIDELINES

### VCC and Ground Routing

Make sure to short–circuit power line externally by a low impedance route on one side of PCB. As high current flows into external FET to GND, connect it to GND through a low impedance route.

The capacitance connected between the VCC pin and the opposite ground is to stabilize the battery. Make sure to connect an electrolytic capacitor with capacitance value of about 10 μF (4.7 μF or greater) to eliminate low frequency noise. Also, to eliminate high frequency noise, connect a capacitor of superior frequency characteristics, with capacitance value of about 0.1 μF and make sure that the capacitor is connected as close to the pin as possible. Allow enough room in the design so the impact of PWM drive and kick–back does not affect other components. Especially, when the coil inductance is large and/or the coil resistance is small, current ripple will rise so it is necessary to use a high–capacity capacitor with superior frequency characteristics. Please note that if the battery voltage rises due to the impact of the coil kick–back as a result of the use of diode for preventing the break down caused by reverse connection, it is necessary to either increase the capacitance value or place Zener diode between the battery and the ground so that the voltage does not exceed absolute maximum voltage.

When the electrolytic capacitor cannot be used, add the resistor with the value of about 1 Ω and a ceramic capacitor with the capacitor value of about 10 μF in series for the alternative use. When the battery line is extended, (20–30 cm to 2–3 m), the battery voltage may overshoot when the power is supplied due to the impact of the routing of the inductance. Make sure that the voltage does not exceed the absolute maximum standard voltage when the power supply turns on.

These capacitance values are just for reference, so the confirmation with the actual application is essential to determine the values appropriately

### RF Routing

Power current (output current) flows through the RF line. Make sure to short–circuit the line from RF through GND as well as GND. The RF resistance must choose the enough power rating

### External FET Output Pins

Since the pins have to tolerate surge of current, make sure that the wires are thick and short enough when designing the PCB board.

### Thermal Test Conditions
